ABSTRACT

The Journal of Psychology: Interdisciplinary and Applied is a leading international journal in psychology dating back to 1935. This study examines its publications since its creation utilizing a bibliometric analysis. The primary objective is to provide a complete overview of the key factors affecting the journal. This analysis includes such key issues as the publication and citation structure of the journal, its most cited articles, and the leading authors, institutions, and countries referenced in the journal. The work uses the Scopus database to classify the bibliographic material. Additionally, the analysis provides a graphical mapping of the bibliographic data by using visualization of similarities viewer software. This software uses several bibliometric techniques including co-citation, bibliographic coupling and co-occurrence of keywords. The Journal of Psychology is strongly connected to most of the current leading journals in psychology, and currently has a 5-year impact factor of 1.77 (*Thomson Reuters, 2015 Journal Citation Reports*).

ARTICLE HISTORY

Received 30 January 2018
Accepted 4 February 2018

KEYWORDS

Bibliometrics; journal analysis; psychology; Scopus

The Journal of Psychology: Interdisciplinary and Applied is a double-blind, peer-review international journal published by Taylor & Francis. It publishes empirical and theoretical articles in such applied areas of psychology as behavioral psychology, cognitive psychology, clinical psychology, educational psychology, consumer psychology and environmental psychology. In addition, the journal seeks to publish interdisciplinary contributions that integrate other disciplines with psychology such as law, economics, politics and religion.

The journal was founded in 1935 in response to the accelerated growth of psychological research. At this point in time, psychology was in full expansion at an academic, institutional, and empirical level.

The publication of the journal has continued uninterrupted until the present day and was the first to publish one or two issues per year (1935 and 1936). From 1937 and until 1964, it went on to publish two volumes per year, two issues for each one. Between 1966 and 1984, the journal published six two-issue volumes a year. In 1985, the editors restructured the internal layout of the journal, organizing it into six annual numbers published in a volume

© 2018 Taylor & Francis Group, LLC

and that continued until the year 2015, when the number of published issues increased to eight per year.

Currently, the executive editors of the journal include: Ron Downey (Kansas State University), Ami Rokach (York University; The Center for Academic Studies, Israel) and John Watt (Texas A & M University). The *Journal of Psychology* publishes eight issues per year, and is one of the top journals in the field with an impact factor of 1.25 according to 2016 *Thomson Reuters, 2015 Journal Citation Reports*[®], and a 5-year impact factor of 1.765 (Reuters, 2015).

The primary purpose of this study is to examine *The Journal of Psychology's* published articles according to the leading articles, authors, institutions, and countries using a bibliometric approach. This method provides a qualitative and quantitative analysis of the journal's contribution to the scientific community through a close analysis of the articles published by the journal. This analysis was conducted using data from the Scopus database. Minimal discrepancies/faults, however, may appear given that Scopus sometimes is not consistent in how it provides the data. This research paper aims at providing an extensive analysis of the development of the publication structure and the citations that derive from the journal based on the most productive authors, institutions, and countries. Understanding the factors that guide the journal can be interesting for the scientific community as well as the journal's target audience.

A bibliometric approach has been applied to other disciplines and in a multitude of different areas. Namely, economy (Coupé, 2003), innovation (Fagerberg, Fosaas, & Sapprasert, 2012), entrepreneurship (Landström, Harirchi, & Aström, 2012), health economics (Wagstaff & Culyer, 2012) and management (Podsakoff, MacKenzie, Podsakoff, & Bachrach, 2008). Additionally, various studies developed a bibliometric analysis of specific journals, including the *Journal of Business Research* (Merigó, Mas-Tur, Roig-Tierno, & Ribeiro-Soriano, 2015), the *Journal of Business and Industrial Marketing* (Valenzuela et al., 2017), *International Journal of Intelligent Systems* (Merigó, Blanco-Mesa, Gil-Lafuente, & Yager, 2017) and *European Journal of Operational Research* (Laengle et al., 2017).

Method

A common way to measure research activity is through metrics associated with publications in peer-reviewed journals (Carleton et al., 2012). These metrics include a recount of articles and citations, as well as factor-impact assessed through the h-index (Hirsch, 2005). This index takes into account the productivity and impact of a set of publications (Krampen, Becker, Wahner, & Montada, 2007). The impact of research and productivity correlate positively (Feist, 1997).

This study focuses on publications by *The Journal of Psychology* over a nearly 80 year period (i.e., 1936 to 2015). The study of bibliometrics allows for the use of different techniques to obtain the data of interest; however, the techniques that are more commonly used are those focusing on the number of studies and the total number of times cited. In addition to these two factors, this study also presents the number of citations per article and the number of studies per person in the section regarding productivity by country. Additionally, the results are in some cases presented according to different thresholds. For instance, the results corresponding to an author indicate the number of studies, the total times the studies were cited, and then the number of articles cited more than 50 times, more than 25 times, and more than 10 times.

Other indicators included are the *h*-index and the impact factor of the journal per year as per the existing records. These structured results allow for a more informed assessment of the rankings, as will be shown in each particular section of the results.

The *h*-index is designed to integrate a person's publications and citations in a single measurement (Harzing, 2010; Hirsch, 2005). For example, a researcher with a 20*h*-index has 20 publications that have received at least 20 citations. However, this index does not take into account other publications by the same author particularly if he/she has received a small number of citations. Other indices are the (i) G-index, which draws on the *h*-index but only focuses on the articles that have a high number of citations (Egghe, 2006; Harzing, 2010), (ii) the *hl*-index, which takes into account co-authorship, and (iii) the annual index-*hl*, which provides a researchers' average influence throughout his or her career (Harzing, Alakangas, & Adams, 2014). Although there is currently some controversy about the best measure to describe the professional profile (Podsakoff et al., 2008), the main assumption is that the number of publications reflects the researcher's productivity and the number of citations refers to the impact of the author in his/her community.

In order to gain a better image of *The Journal of Psychology's* contribution towards the scientific community, this study includes the most significant indicators that offer a comprehensive overview of published production. The tables that appear in this paper display sets of analyses from different perspectives, including productivity influence within the scientific community, institutions, and countries. In addition, the study includes the quotations/article ratio to measure the influence of the article and the indicator of the number of items that have a certain level of influence (Merigó, Gil-Lafuente, & Yager, 2015).

The information analyzed in the paper is available on the Scopus database and was retrieved between August and October 2016. The results offer an up-to-date bibliographic overview of *The Journal of Psychology* during the time period indicated.

Results

This section presents the results of the bibliometric analysis of studies published between 1936 and 2015 by *The Journal of Psychology* utilizing the Scopus database. The results include articles, notes, and reviews, as is the general practice in this method. The total number of documents amounted to 7392, with a total number of citations of 42846 and an *h*-index of 59. The *h*-index indicates the *h* number of articles that have been cited *h* times. In this case, it means that *The Journal of Psychology* has 59 articles that have been cited at least 59 times. In addition, each article has been cited on average 9.06 times.

Publication Evolution and Citation Structure of The Journal of Psychology

The results for the first year of publication of *The Journal of Psychology* are to be expected. In 1936 only 14 items were published; however, the total citations of these studies are surprisingly high (104), which indicates a good acceptance and moderate impact in relative terms. The progress of the journal in terms of citations and number of publications is rather irregular. During the first decades, the number of publications increased, except for selected years. Table 1 shows the citation structure for all years (1936–2015), while Figures 1 and 2 present a graph with the publication evolution for different periods.

Table 1. Citation Structure of *The Journal of Psychology*.

Abbreviations: TP = Total publications; TC = Total citations; H = h-index; ≥ 75 , ≥ 50 , ≥ 25 , ≥ 10 , ≥ 5 , ≥ 1 = Number of documents with equal or more than 75, 50, 25, 10, 5 and 1 citation.

Following the publication of 14 articles in the journal's founding year (i.e., 1936), that number increased to 69 articles the following year. This approximate number is maintained until 1942, where there was a significant decrease to 12 during World War II. The most remarkable period of the series is during 1964–1984. During the period 1980–2009 the number of studies cited more than 25 times increases and is reasonably consistent (between 6 and 12 studies most years). This result is a quality indicator, but also represents the expansion of research thanks to the surge of the Internet because, even though its more user-friendly version appeared in the nineties, the texts published during the previous decades could be easily added a posteriori to a database.

The published articles received approximately 43,000 citations. A more detailed analysis reveals that 44 articles received more than 75 citations, 112 articles received between 50 and

**Figure 1.** Publication evolution 1936–2016.

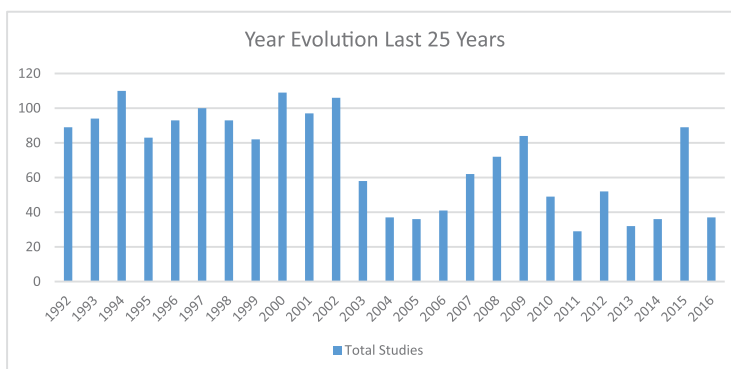

Figure 2. Publication evolution 1992–2016.

74 citations, and 338 articles received between 25 and 49 citations. To some extent, the pace of progress concerning the number of citations throughout this period has been rather steady. Even so, discernible peaks were produced in the years 1946, 1994–1998, 1999, 2001, and 2002, with figures exceeding 1100 and 1200 citations. Similarly, the most outstanding peaks were produced in 1980 and 2009, when the number of citations reached an impressive 1783 and 1537, respectively (Table 1).

Table 1 also reflects the impact factor (IF) of the journal according to the measure of Web of Science (WoS) platform. The IF reflects the number of citations in a year of the documents published in years $x-1$, $x-2$. The IF index has been criticized because it is easy to manipulate (Bonilla, Merigó, & Torres-Abad, 2015). For this reason, the WoS uses IF for 5 years as it seems more robust against possible manipulations. *The Journal of Psychology* has been included uninterruptedly in the WoS since 1997. The first year it had an impact factor of 0.250, which fell slightly after the second year, and since 1998 this IF has seen an increase, reaching up to 1.250 in 2015 (latest year available in the WoS). The journal is located in Quartile 2 of the category Psychology-Multidisciplinary (Rank 56/129).

Focusing on the period 1980–2016, the annual number of research published has decreased. It's not clear if this decrease is shared by other psychology journals. Despite the influence in quality production, the advent of the Internet may have also produced the decrease in publications: since authors have access to a greater variety of published works, they may find that some of the ideas have already been developed and published elsewhere. Although in the last years the number of publications has been reasonable, the number of citations is still understandably low. This result is normal given that publications are recent and the typical time lag that occurs between publication and subsequent citation by others. It is important to note that the full results for 2016 are incomplete given that this study was performed before the end of that year.

Most Cited Papers

Table 2 presents the most cited papers published in *The Journal of Psychology* according to Scopus. *The Journal of Psychology* has had and still continues to have an important influence on the research field of psychology. This success is represented in the following chart in the times articles published in this journal have been cited.

Table 2. Most Cited Papers in *The Journal of Psychology*.

Abbreviations available in previous tables except: TC/year = Cites per year.

Only the sum of the two most cited articles, by Heider (1946) and Stogdill (1948), exceeds 1400 citations. Below, the five most cited articles are described in detail. The first refers to “Attitudes and cognitive organization,” by Heider (1946), and deals with the relationship between attitudes toward an event and the person or entity that caused a particular event. The central focus of Heider’s research is on the nature of interpersonal relations and the theory of attribution, articulated into two categories, internal attributions (personal) and external (situational) powers (Heider, 1958) receiving 12.51 citations per year. The second most cited article is by Stogdill (1948) and is titled “Personal factors associated with leadership: a survey of the literature.” The popularity of the article may owe in this case to the fact that the author provides a review of the literature on a particular topic, which can still today be consulted by other scholars to build their own literature review. Were it not for this article, it would probably be impossible in some cases to access texts dating as far back as the first decades of the twentieth century. This article receives an average of 16.95 citations per year.

David Wechsler occupies the third position in Table 2 with his paper on the evaluation of the report entitled “A standardized memory scale for clinical use.” Wechsler devoted his research at the Bellevue Psychiatric Hospital in New York to the operation of memory and intelligence, devising ways of measuring the intellectual ratios and ratios of memory. This article describes how to obtain a MQ (memory quotients), focusing on spatial and temporal orientation, mind control, immediate memory of logical material, forward and reverse, digit visual reproduction and learning and recalling/retaining, using a list of 10 associated partners. This article has received a total of 481 citations and an average of 6.77 citations. D. Wechsler is the author of the Wechsler Adult Intelligence Scale (WAIS), Wechsler Intelligence Scale for Children (WISC) and the Wechsler Preschool and Primary Scale of Intelligence (WPPSI), which has worldwide recognition.

Paolucci, Genuis, and Violato’s (2001) article “A meta-analysis of the published research on the effects of child sexual abuse,” which again stresses the popularity of articles dealing with the analysis of existing research, holds the fifth position. Interestingly, the top three articles date from the nineteen forties and nine articles in this list date from the same decade. Four of the ten most cited articles are from the 2000’s, which is significant because despite the short time lapsed after their publication, they have obtained a considerable amount of recognition from other scholars. A remarkable case is that of the article by Dooley, Pyzalski, and Cross (2009), which receives 28.29 citations per year and appears in the seventh position of the chart. This qualitative and conceptual study focused on similarities and differences between cyberbullying and bullying. The discussion on this issue continues due to the increase in cases of harassment and cyberbullying suffered by children and adolescents.

Most Influential Countries

Perhaps unsurprisingly, authors from the USA rank first with 4170 studies and 19,920 total citations received. Articles published in the USA are the most cited, with 18 articles receiving more than 75 citations, 56 items receiving between 50 and 74 citations, and 159 articles receiving between 25 and 49 citations (Table 3).

On another note, the first four countries on the list –USA, Canada, UK, and Australia– are Anglophone countries, which is to be expected to some extent given that the language the journal publishes in is English and other countries may diversify their publication in journals in other languages.

Table 3. The Most Productive Countries in *The Journal of Psychology* (1936–2016).

50 Most Influential Institutions

Regarding the most productive institutions, 45 of the top 50 are in the USA, 2 in Israel, 2 in Canada, and 1 is in Turkey. The universities with a higher number of studies are from the USA and include the following: the Michigan State University (77), the Columbia University in the city of New York (76), the University of California, LA (68), Harvard University (63) and Ohio State University (59). The universities that follow are the University of Georgia (58), St. John's University (53), and New York University (51). As to the number of citations, the University of California ranks first with 840 citations. It is noteworthy to mention that St. John's University, which occupies the 7th position with 53 studies, is the institution of affiliation of John B. Murray, the second author with the most articles published in *The Journal of Psychology* according

to Table 2. Therefore, some of these institutions may hold a high place in the list thanks to one or few authors.

Outside of the USA, institutions with greater productivity are Orta Dogu Teknik U (Turkey), in the 13th position, and University of Calgary (Canada), in position 15 (Table 4). The University of Calgary, in Canada, ranks 15th in the list but has more studies cited more than

Table 4. The Most Productive and Influential Institutions.

Abbreviations are available in previous tables except: ARWU = Academic Ranking of World Universities; QS = Quacquarelli & Symonds University Ranking.

50 times (3), more than 25 times (8), and more than 10 times (20) than other institutions with more total studies do. These data imply a high quality and impact of the articles produced by authors in these institutions (Table 4).

The institutional contribution to the journal relates to both regional and internal university rankings according to their scientific productivity. Thus, among the ten universities with the largest number of articles published in the journal we can find Harvard University and Columbia University. They usually hold positions in the Top 10 of the Shanghai Ranking (2016), which is an indicator of the high quality and quantity with which these institutions contribute to the growth of science.

Split rankings of Academic Ranking of World Universities (ARWU) universities uses four objective indicators: (1) number of articles published in scientific journals, especially the journals indexed in the Science Citation Index – Expanded and Social Sciences Citation Index, (2) the number of citations received by the researchers according to Thomson Reuters, and (3) the yield per capita of a university. It also includes (4) the number of graduates and researchers (Nobel prizes and Fields medals) awards. The methodology used in the ARWU is solid, stable, and transparent, hence the ARWU is a reference to describe quality and scientific productivity.

Most influential institutions of each five-year period since 1936

The Tables A.1 to A.16 in the appendix show the most influential institutions of each five-year period. This breakdown of the data allows for a more thorough assessment. The first striking fact shown by the tables is the progressive internationalization or diversification of the institutions in the ranking. While the rankings from 1936 until the 1980's show a clear predominance of American institutions, from then on, the presence of other institutions such as U. of Calgary (Canada) and Orta Dogu Teknik Universitesi or Bar-Ilan University (Israel) indicates a marked diversity regarding research origin. The second notable observation is the change in institutions appearing in the top positions. Harvard University ranks first in the first and third tables, in the second one this university ranks tenth, while it disappears altogether from 1962 onwards. The high variation in the names of the rankings since the 1960's may owe to the mentioned internationalization of the journal, but also to decisions or situations within the institutions such as the departure or retirement of a prolific scholar. Similarly, Columbia University appears in the top 11 positions until 1992, when it ceases to appear in the most influential institutions list. Finally, a third interesting observation is that of Orta Dogu Teknik Universitesi, in Turkey, which appears in the top positions since 1998. This institution has ranked first on two occasions (Tables A.7 and A.8).

Mapping the Journal of Psychology with VOS Viewer Software

In order to deepen in the analysis of the bibliographic data, this section develops a graphical visualization of the publications of *The Journal of Psychology*. To do so, the work uses the visualization of similarities (VOS) viewer software (Van Eck & Waltman, 2010). This software collects the bibliographic material and develops different bibliometric techniques including co-citation of journals (Small, 1973), co-occurrence of author keywords (Laengle

Abbreviations: Cit = Citations; CLS = Citation link strength.

Another interesting element examined is co-citations of journals highly cited in *The Journal of Psychology*. Co-citation occurs when two journals receive a citation from the same document of a third journal. Figure 4 presents the co-citation network of the journal.

The Journal of Personality and Social Psychology and the Journal of Applied Psychology are the most cited journals and have the strongest network in the journal. The majority of the journals are from the psychology area although, notably, some management journals also appear in the figure. In order to obtain a more specific picture of the most cited journals in The Journal of Psychology, Table 5 presents the Top 30 considering a global perspective and the evolution over the last three decades.

The results of the table confirm the results of Figure 4. Additionally, most of the journals focus on psychology although some management journals also appear in the list, including the Journal of Management and the Academy of Management Review.

To analyze co-citation of documents, Table 6 and Figure 5 present the thirty most cited documents in the journal.

Regarding the most cited authors in the Journal of Psychology, the software develops co-citation of authors. Figure 6 presents the results considering a threshold of 50 citations and the 100 most representative connections. Note that for building this figure, the work uses the Scopus database.

Some very well-known authors in psychology appear highly cited in the journal. Among others, it is worth noting Bandura, Furnham, Beck, McRae, Ryan, and Schaufeli.

Table 6. Top 30 Most Cited Documents in *The Journal of Psychology*.

Abbreviations available in previous tables.

institutions from the same country tend to be more close to each other due to co-authorship and a research profile that follows similar patterns.

Conclusions

This article provides a bibliographic overview of the research published in *The Journal of Psychology: Interdisciplinary and Applied* throughout its long tenure, starting from the data gathered from Scopus and the use of bibliometric indicators. The results show that *The Journal of Psychology* has gone through different stages. The first stage (until 1962) captured the period in which the number of publications and their impact on the scientific community was modest, with the exception of the year 1946. That year Heider published his article on “Attitudes and cognitive organization,” which has received over a thousand citations. The second stage (1962–1984) was a period in which the number of publications from the journal increased considerably. The third stage, from 1985 to 2002 was a period in which the number of publications decreased slightly, but a growing trend emerges regarding the number of citations. During this stage, there are fewer articles with more than 75 citations, but the groups from 25 to 74 citations increases significantly (136). This is important because it denotes some dispersion concerning the weight of the citations.

From 2003 on, the outcome noticeably changes; that is, the total number of published articles diminishes, but the number of citations is maintained (not counting the three most current years). 2009 is a notable exception; with more than 1500 citations being reported. That year (2009) two articles on bullying and cyberbullying were published, both receiving great acceptance: one written by Dooley, Pyzalski and Cross (2009), and the other by Grading, Strohmeier and Spiel (2009).

Analysis of the institutions and countries has shown that American universities are leading publishers in the journal, followed by the UK and Australia, all of them predominantly English-speaking countries. In recent years, however, there has been an expansion of universities and countries, giving coverage to research from institutions located in the Middle East (Israel, Pakistan, Lebanon, etc.), Europe (Germany, Netherlands, Turkey, Italy, Sweden, Belgium, Switzerland, France, Spain, etc.) countries in Southeast Asia (China, Taiwan, Japan, India, New Zealand, etc.), African countries (South Africa, Nigeria, Senegal, etc.) and countries in South America (Chile, Argentina, Mexico, etc.). The increase in the diversity of institutional representation is a reflection of the increased expansion of research in other parts of the world.

Results from the bibliographic examination revealed that, there is a core/nucleus composed of the 10 most cited authors whose articles receive roughly 50% of the citations of the journal. A large amount of citations depends on few articles and a large number of articles receive the same number of citations than the core which is rather low.

Finally, this bibliometric analysis of the journal has some limitations that should be noted. First, research in psychology is very broad and interdisciplinary, and although the journal is interdisciplinary, publishing a diverse number of topics, not all of them are reflected in the journal. Second, this bibliometric analysis gives every author a unit just as Scopus does. Therefore, the articles signed by several authors have better results. For example, two articles with four signatories provide two units to each of them, with a result of eight. Thus, from

this example, the number of signatories leads to a better outcome. However, in general, this issue does not significantly affect the results. Thirdly, the increase in citations within the last few years is a reflection of the overall growing condition of the journal. Widespread access to documental sources through the internet (e.g., Web of Science, ProQuest, Scopus, PsycINFO PubMed, MEDLINE, Current Contents, among others) facilitates the spread and the knowledge of research conducted by the researchers themselves. Despite these limitations, this bibliometric analysis identifies the most influential trends presented in *The Journal of Psychology*, and should prove valuable to potential authors and the journal's general readership.

Author Notes

Ana Tur-Porcar is an associate professor at the University of Valencia. Her research is focused on personality, prosocial behavior, entrepreneurship and emotions. She has published papers in journals such as the *Journal of Business Research*, *Personality and Individual Differences*, the *Journal of Adolescence*, *Psychology & Marketing*, *Quality & Quantity* and the *Journal of Cross-Cultural Psychology*. She is or has been on the editorial board, guest editor and referee of several indexed journals.

Alicia Mas-Tur is a lecturer in the Management Department at the University of Valencia. She has presented numerous papers at international conferences. She has also published articles and books in international journals including *Service Industries Journal*, *International Entrepreneurship and Management Journal*, and *Service Business*. She is or has been the guest editor and referee for international journals. She is or has been on the editorial board of several journals including the *Journal of Business Research and Contemporary Economics*.

José M. Merigó is a professor at the Department of Management Control and Information Systems at the University of Chile. He has published more than 400 papers in journals, books and conference proceedings. He is or has been on the editorial board of several journals including the *Journal of Business Research*, *Technological and Economic Development of Economy* and *Journal of Intelligent & Fuzzy Systems*. He has been recognized as a Highly Cited Author in Computer Science by Clarivate Analytics (Thomson & Reuters).

Norat Roig-Tierno is a professor at the ESIC Business & Marketing School and the Polytechnic University of Valencia. He has presented numerous papers at international conferences. He has published articles and books in international journals including *Service Industries Journal*, *Journal of Business Research*, and *Applied Geography*. He is or has been on the editorial board of several journals including the *Journal of Business Research* and *Journal of Innovation and Knowledge*.

John Watt is a clinical associate professor of management at Texas A&M University. He is responsible for teaching undergraduate and graduate courses in Creativity and Innovation, Organizational Behavior/Management, and Leadership. He is Executive Editor of *The Journal of Psychology: Interdisciplinary and Applied*. He has published articles and books in international journals including *Journal of Applied Psychology*, *Journal of College Student Development* and *Journal of Research in Personality*.
