Supporting material: machine-readable table

1. Minor Corrections

In Table 1 the declination of SN 2005ku should read −00:00:49.3. The arithmetical sign was wrong.

In Table 4 the *i*-band color term should be identically zero.

Revised versions of Tables 1 and 4 are given here in their entirety. In Table 4 note the two different values of the *J*-band color term for the duPont telescope. Only one was given in the original published version of this paper (Krisciunas et al. 2017a). This omission has already been noted in a published erratum (Krisciunas et al. 2017b).

2. Field Star Photometry of Our Supernovae

David Rubin, presently at the University of Hawaii, kindly pointed out a problem with Table 5 of our paper. Rubin compared PanSTARRS photometry of field stars with our photometry. He found no problems with the $g'r'i'$ data. Then he used nonlinear color transformations to compute (i.e., predict) *V*-band values and used nonlinear transformations and incorporated $u' - g'$ as an extra color to compute *B*-band values. There were no problems revealed in the preliminary *BV* photometry of field stars presented in CSP-I Data Release 2 (Stritzinger et al. 2011), but Rubin found systematic errors in our *B*- and *V*-band photometry presented in the third (and final) data release paper of CSP-I (Krisciunas et al. 2017a).

We have identified the cause of the problem. Recall that the procedure for our natural system photometry is:

(1) Observe fields of standard stars at a range of air masses, and derive color terms and extinction coefficients.
(2) Invert the color equations and transform the standard Sloan $u'g'r'i'$ photometry (Smith et al. 2002) and *BV* magnitudes (Landolt 1992) into CSP natural magnitudes.
(3) Calibrate our local sequence stars relative to these natural magnitudes. Note that there are no color terms to deal with here, only extinction coefficients and nightly zero-points.
(4) Calibrate supernova photometry relative to local sequences. Supernova photometry is therefore in the natural system of the telescope and camera.
(5) Reapply the color terms to convert local sequence star photometry into the standard system for publication.

[16] Deceased.

Table 1

Notes.
[a] Host-galaxy morphology and heliocentric redshift are from the NASA/IPAC Extragalactic Database (NED) or SDSS unless otherwise indicated.
[b] References/URLs: CHASE (http://das.uchile.cl/proyectoCHASE/); CSS (http://lpl.arizona.edu/css/); LOSS (Filippenko et al. 2001; Filippenko 2005; Leaman et al. 2011); Perth (Williams 1997); ROTSE-III (Quimby 2006); Puckett (http://cometwatch.com); Tenagra-II (http://tenagraobservatories.com/Discoveries.htm); SDSS-II (Frieman et al. 2007).
[c] Host-galaxy redshift of SN 2005gj from Prieto et al. (2007). Note that Aldering et al. (2006) give $z = 0.0667$.
[d] Most likely host according to Foley et al. (2009). See the text for further details.
[e] The host of SN 2006is was observed with the Magellan Baade Telescope and IMACS; the hosts of SNe 2006lu and 2008fr were observed with the du Pont 2.5 m and WFCCD. Emission/absorption lines for radial velocity determination were weighted according to their equivalent widths.
[f] Ambiguous host. See the text for further details.

Table 4
Photometric Reduction Terms

Filter	Extinction Coefficient[a]	Color Term[b]
	Swope+SITE3	
u	0.511 ± 0.057	0.046 ± 0.017
B	0.242 ± 0.022	0.061 ± 0.012
g	0.191 ± 0.021	−0.014 ± 0.011
V	0.144 ± 0.018	−0.058 ± 0.011
r	0.103 ± 0.019	−0.016 ± 0.015
i	0.059 ± 0.020	0.000 ± 0.015
	Swope+RetroCam	
Y	0.044 ± 0.012	...
J	0.076 ± 0.015	0.016[c]
H	0.041 ± 0.013	−0.029[c]
	duPont+WIRC	
Y	0.044 ± 0.012	−0.042[c]
J	0.076 ± 0.015	+0.039/+0.016[c]
H	0.041 ± 0.013	−0.029[c]

Notes.
[a] Measured in mag airmass^{-1}. All uncertainties in this table are the standard deviations of the distributions, not the standard deviations of the means.
[b] See Equations (9)–(14) or (15)–(20) for which standard colors are used in combination with these coefficients to obtain the color correction terms for the optical photometry. The *V*-band photometry obtained with the LC-3009 filter and given in Table 9 is associated with a color term of −0.044. See Appendix B of Paper II. As described in the text, color terms are not needed to transform the *J* and *H* magnitudes between the Swope +Retrocam and duPont+WIRC natural systems.
[c] Color terms estimated from synthetic photometry of the Castelli & Kurucz (2003) stellar atmosphere models. The *J*-band color term for the duPont telescope was +0.039 prior to 2009 January 15 and +0.016 starting on that date.

Table 5
Optical Photometry of Secondary Standards[a]

ID	α (2000)	δ (2000)	u'	g'	r'	i'	B	V

Note. This table replaces Table 5 of Krisciunas et al. (2017a) and is published in its entirety in the electronic edition of the journal. A portion is shown here for guidance regarding its form and content. The previously published $u'g'r'i'$ photometry was correct. Here we present revised B- and V-band photometry.
[a] All photometry is measured in magnitudes. Values in parentheses are 1σ uncertainties, measured in thousandths of a magnitude. This photometry of field stars is in the two standard systems, not the natural system.

(This table is available in its entirety in machine-readable form.)

The mistake happened in step number 5. Thus, if one wishes to use our *BV* photometry of field stars in the standard system, one should use the revised values in the accompanying table. It is important to note that our SN photometry (which is in the natural system) is *not* affected by the error described here.

An abbreviated version of Table 5 is given here. The full machine readable table will be available online.
