

Table of Content

CHAPTER 1. MOTIVATION	1
CHAPTER 2. INTRODUCTION	4
2.1. The duration of magma pulses in light of the water budget of reservoirs	6
2.2. Geochemical insights into the interpretation of the occurrence of zircon in crustal A- and S-type magmas.....	8
2.3. Study workflow	9
2.4. Geological context of the studied plutons	10
2.4.1. The Elqui-Limarí batholith.....	11
2.4.2. Late Triassic post-orogenic plutons: the Los Tilos and Monte Grande plutons.....	13
2.5. Objectives and methodologies	14
2.5.1. General objective.....	14
2.5.2. Specific objectives and methodologies	14
2.5.3. Analytical conditions and operating conditions	15
2.6. Presentation and organization of this thesis	17
CHAPTER 3. CRUSTAL MAGMAS AND ZIRCON AS A PETROGENETIC MARKER: STATE OF THE ART	19
3.1. Crustal melting mechanisms	19
3.1.1. Heat sources	19
3.2. Water-fluxed and dehydration melting.....	20
3.2.1. Volatile-phase present melting (low-temperature <i>anatexis</i>).....	20
3.2.2. Volatile-free melting (high-temperature <i>anatexis</i>).....	21
3.3. Geodynamic significance of the melting P-T paths	23
3.4. Melt segregation, extraction, and migration.....	24
3.4.1. Allochthonous granites.....	24
3.4.2. Parautochthonous and autochthonous granites.....	26
3.5. Thermodynamic modeling and phase equilibria: Energy constraints on <i>anatexis</i>	26
3.6. Zircon as a petrogenetic marker	31
3.6.1. Crystallization ages	31
3.6.2. Crystallization temperatures.....	31
3.6.3. Zircon host-rock characterization.....	32
3.6.4. Magma oxidation state	32

3.6.5. Zircon as a petrogenetic tracer	33
CHAPTER 4. THERMODYNAMIC MODELING OF CRUST ANATEXIS: RESULTS AND DISCUSSIONS	34
4.1. Crust anatexis conditions under variable water content	35
4.2. Energy requirement for crustal anatexis under variable water content	38
4.3. Crust melting under water-saturated conditions and implications on the stability of entrained zircon grains	40
CHAPTER 5. ZIRCON INHERITANCE FROM THE SOURCES OF THE STUDIED LATE TRIASSIC PLUTONS (PUBLISHED IN LITHOS).....	46
CHAPTER 6. COEXISTENCE OF A- AND S-TYPE PLUTONS DURING THE CONSTRUCTION OF THE LATE TRIASSIC CENTRAL CHILE ANDES BASEMENT: FINAL CONSIDERATIONS	65
6.1. Source materials, petrogenetic conditions and tectonic implications.....	65
6.2. Understanding the preservation of inherited zircons in the studied magmatic systems	67
CHAPTER 7. CONCLUSIONS	69
BIBLIOGRAPHY	71
ANNEXES.....	86
A. Models of isochemical pseudosections in the KCFMASH system at a 600°C temperature.....	86
Lower Crust.....	86
Middle Crust.....	87
Upper Crust.....	88
B. Melt fraction of crustal magmas	89
C. Modeled composition of anatectic melts	90
Upper Crust	90
Middle Crust.....	91
Lower Crust.....	92
D. Modeled ASI vs AI indexes	93
Pressure-sensitive models: Upper Crust.....	93
Pressure-sensitive models: Middle Crust	94
Pressure-sensitive models: Lower Crust	95
Temperature-sensitive models: Upper Crust.....	96
Temperature-sensitive models: Middle Crust	97
Temperature-sensitive models: Lower Crust	98

E. Whole-rock geochemistry.....	99
Samples UTM Coordinates (WGS84).....	99
Major elements.....	100
Trace elements.....	102
F. Mineral chemistry	106
Electron Microprobe Analysis data (Pyroxene)	106
Electron Microprobe Analysis data (Cordierite).....	107
Electron Microprobe Analysis data (Amphibole)	108
Electron Microprobe Analysis data (White Mica)	110
Electron Microprobe Analysis data (Black Mica).....	111
Electron Microprobe Analysis data (Zircon).....	112
LA-ICP-MS data (Zircon).....	113
Zircon U-Pb LA-IC-MS data (corrected ratios).....	115
G. The petrogenesis of selected cordierite granites in South America (published in JSAES)	117
