Resumen	i
Abstract.....	ii
Acknowledgments	iii
Chapter 1: Introduction.....	1
1. Problem setting.....	1
2. Key idea of the thesis and objectives	3
3. Novel aspects.....	3
4. Hypotheses	4
Chapter 2: Literature review	5
1. Multigaussian simulation of continuous variables (grades).....	5
1.1. Matrix decomposition method	6
1.2. Sequential algorithm	7
1.3. Turning bands	8
1.3.1. Generating lines	8
1.3.2. Deriving the covariance function of the one-dimensional random fields	9
1.3.3. Generating realizations along the lines.....	11
1.4. Spectral - turning bands simulation	12
1.5. Variants of spectral simulation	15
2. Simulation of categorical variables (rock types).....	17
2.1. Truncated Gaussian model.....	17
2.2. Plurigaussian model.....	19
2.3. Gibbs sampler	21
2.3.1. First stage: Initialization	21
2.3.2. Second stage: Iteration.....	22

3. Joint simulation of grade and rock types.....	23
--	----

Chapter 3: From stationary to intrinsic random fields of order k26

1. Non-stationary geological domains.....	26
2. Review of stationarity hypotheses.....	27
2.1. Stationary random fields (strict stationarity)	28
2.2. Second-order stationarity	28
2.3. Intrinsic stationarity (IRF-Order 0).....	28
3. Non-stationary modeling.....	31
3.1. Universal kriging	31
3.2. Intrinsic random fields of order k (IRF- k).....	34
3.2.1. Introduction	34
3.2.2. Generalized increments of order k (authorized linear combinations of order k)	35
3.2.3. Definition of intrinsic random fields of order k (IRF- k).....	39
3.2.4. Generalized covariance.....	40
3.2.5. Generalized variogram	43
3.2.6. Internal representation	44
3.2.7. Intrinsic kriging	45
3.2.8. Simulation of an IRF- k with Gaussian generalized increments	46

Chapter 4: Methodology48

1. Inference of model parameters.....	48
1.1. Inference of the grade model	48
1.2. Inference of the rock type model	48
1.3. Inference of the cross-correlation structure	53
1.4. Summary	55
1.5. Examples of bivariate covariance models	56
2. Joint simulation	59
2.1. Non-conditional simulation	59
2.2. Conditioning to data.....	64

Chapter 5: First case study	66
1. Introduction	67
2. Methodology	68
2.1. Multi-Gaussian simulation of grades	68
2.2. Plurigaussian simulation of rock types	68
2.3. Joint simulation of grade and rock type	69
3. Case study: Lince-Estefanía deposit	70
3.1. Geological description	70
3.2. Presentation of the data set	70
3.3. Contact analysis	73
3.4. Copper grade modeling	73
3.5. Rock type modeling	75
3.5.1. Truncation rule	75
3.5.2. Variogram analysis	78
3.6. Modeling the spatial dependence between grade and rock type	80
3.7. Joint simulation results	81
3.8. Cascade simulation of grade and rock type	83
3.9. Comparison of results	85
3.9.1. Distribution of copper grade conditioned to rock type	85
3.9.2. Spatial correlation of copper grade conditioned to rock type	86
3.9.3. Rock type boundaries	87
4. Conclusions	90
5. Appendix A. Relations between indicator direct and cross variograms	90
6. Appendix B. Distributions of grade conditional to rock type	91
Chapter 6: Second Case study	94
1. Presentation of the case study and exploratory data analysis	94
2. Spatial structure analysis	98
2.1. Structural analysis of copper grade	98
2.2. Joint structural analysis of copper grade and rock type	99

3.	Conditional simulation	103
4.	Post-processing the realizations	106
4.1.	Post-processing the copper grade realizations	106
4.2.	Post-processing the rock type realizations	108
5.	Model validation	109
5.1.	Split-sample validation using drill hole data	109
5.2.	Validation using blast hole data	112
6.	Comparison with the cascade approach	114
6.1.	Reproducing the nature of the rock type boundary	114
6.2.	Prediction of copper grades	116
6.3.	Quantification of grade uncertainty	117
Chapter 7: Discussion and conclusions.....		119
1.	General discussion.....	119
2.	Conclusions	120
Chapter 8: Bibliography		121
