

TABLA DE CONTENIDO

CAPÍTULO I	1
1.Introducción.....	1
1.2. Contenido de la tesis.....	2
1.3. Objetivos de la investigación.....	3
1.3.1.Objetivo General.....	3
1.3.2.Objetivos específicos.....	3
1.4. Alcance de la investigación.....	4
1.5. Metodología de investigación.....	4
CAPÍTULO II.....	6
Revisión experimental del comportamiento de material granular fino en minería de caving	6
Resumen.....	6
2.1. Introducción.....	6
2.2. Equipo de laboratorio para el estudio de un flujo gravitacional no confinado.....	8
2.2.1. Definición del material.....	9
2.2.2. Metodología experimental.....	10
2.3. Análisis de similitud.....	10
2.4. Resultados experimentales.....	11
2.4.1. Geometría de la zona de extracción.....	12
2.4.2. Implicación en el diseño minero.....	13
2.5. Conclusiones.....	14
Bibliografía.....	15
CAPÍTULO III.....	16
Gravity Flow Characterization of Fine Granular Material in Presence of Moisture for Block Caving Mining.....	16
3.1. Introduction.....	16
3.2. Analysis of similitude for fine granular flow.....	17
3.2.1. Model media.....	17
3.2.1.1. Size distribution.....	17
3.2.1.2. Shear strength characterization.....	18
3.2.1.3. Analysis of forces.....	19
3.2.2. Geometry of the physical model.....	21
3.2.3. Boundary conditions.....	22
3.3 Experimental Methodology.....	23
3.4. Experimental results analysis.....	24
3.4.1. One drawpoint - Isolated draw.....	25
3.4.2. Two drawpoints – Interaction drawn.....	28
3.4.3. Interferences during the flow.....	29
3.5. Conclusions.....	31
Bibliography.....	33

Appendix A.....	35
Interparticle forces effect on the model media	35
CAPÍTULO IV.....	36
4.1 Dimensional Analysis	36
4.1.1 Mathematic model for isolated extraction - IEZ	38
4.1.2 Mathematic model for extraction from two drawpoints - EZ	41
4.2 Conclusions	42
Bibliography	43
CAPÍTULO V	36
5.1 Conclusiones.....	36
5.2 Trabajo Futuro	46
BIBLIOGRAFÍA	47

Índice de Tablas

Capítulo II

Tabla. 2.1: Resumen de los parámetros obtenidos en los experimentos	11
---	----

Capítulo III

Table. 3.1: Flow factor between prototype and physical model.....	23
Table. 3.2: Summary of data obtained during experimental	24
Table. 3.3: Ratio between drawpoint width and flow zone width, considering Laubscher data and experimental data.....	26
Table. 3.4: Summary of hang- up frequency obtained during experiments	30

Capítulo IV

Table. 4.1: Variables used for dimensional analysis	37
---	----

Índice de Ilustraciones

Capítulo I

Fig. 1.1: Metodología de investigación	5
--	---

Capítulo II

Fig. 2.1: Guía de diseño – Laubscher 1994	7
Fig. 2.2: Modelo físico no confinado – Escala 1:75.....	9
Fig. 2.3: Distribución granulométrica de la muestra a ensayar	9
Fig. 2.4: Geometría de IEZ en función de la humedad para distintas masas acumuladas extraídas. a) Diámetro b) Altura.....	12
Fig. 2.5: Corte longitudinal del elipsoide a distintas humedades con una masa de extracción acumulada de 21.4 kg. Las dimensiones se encuentran en cm.....	13
Fig. 2.6: Proyección de los diámetros de IEZ con humedades de 0, 2,4 y 6% en la malla de tiraje de Esmeralda. Las dimensiones se encuentran en metros.	14

Capítulo III

Fig. 3.1: Size distribution of fine cave rock at Esmeralda Mine	18
Fig. 3.2: Maximum shear strength for the media tested.....	18
Fig. 3.3: Unconfined compression for three samples at Diablo Regimiento mine. (Castro et al., (2017))	19
Fig. 3.4: Relation between gravity force (F_G) and capillary forces (F_C) as a function of fragment size, for four humidity values.	20
Fig. 3.5: Interparticle forces effect as a function of material fragment size.....	21
FC: Capillary forces; FG: Gravity force.....	21
Fig. 3.6: Experimental set-up – Scale 1:75 - Physic model, distribution of markers in ore column and drawbell dimensions	22
Fig. 3.7: Vertical load expected at the mine as a function of depth and draw-zone diameters	23
Fig. 3.8: Evolution of a "No Flow" condition - Cross-sectional view of the drawbell	24
Fig. 3.9: Evolution of the ellipse to different accumulated extraction mass with 4% moisture - Isolated draw - Longitudinal view to the drawbell	25
Fig. 3.10: Height of the extraction zone as a function of accumulated extraction mass with 4% moisture - Tests with draw from two drawpoints - Longitudinal view to the drawbell.....	25
Fig. 3.11: a) IEZ height and b) IEZ width as function of accumulated masses, for different humidities. Inside: Ellipsoid geometry (HIEZ and WIEZ) as a function of humidity.	27
Fig. 3.12: a) EZ height and b) EZ width as function of accumulated masses, for different humidities. Inside: Ellipsoid geometry (HEZ and WEZ) as a function of humidity.....	29
Fig. 3.13: Hang up frequency in one drawpoint at the Esmeralda Sector at El Teniente mine	31

Capítulo IV

Fig. 4.1: Data fit for Π as a function of the dimensionless group $\Psi = \Psi\Lambda_1, \Lambda_2$ Isolated case. The solid black line represents a polynomial function of degree 2.	40
Inside: Experimental Π as a function of Theoretical Π , where the solid black line indicates the identity. a) Width, b) Height.....	40
Fig. 4.2: Data fit for Π as a function of the dimensionless group $\Psi = \Psi\Lambda_1, \Lambda_2$ Alternate case. The solid black line represents a polynomial function of degree 2.	42
Inside: Experimental Π as a function of Theoretical Π , where the solid black line indicates the identity. a) Width, b) Height.....	42
