

# An unusual dimeric sesquiterpene and other constituents from Chilean *Baccharis* species

Zdero, C.

Bohlmann, F.

Niemeyer, H. M.

The aerial parts of *B. santelicensis* afforded several known furoclerodanes and phenolics. In addition to known compounds an unusual dimeric sesquiterpene and five labdane derivatives were isolated from *B. petiolata*. The structures were elucidated by high field NMR techniques and a few chemical transformations. © 1991.
