Haase, W.

This paper describes the synthesis and characterisation of methacrylic liquid crystalline side chain polymer containing azo group, with (PM6OAn) and without (PM6An) hydroxyl group. The characterisation was done by using a polarised light microscope (PLM), differential thermal analysis (DTA), and X-ray diffractometry. All compounds developed bilayer smectic phase, with a certain degree of interdigitation between the layers.

Poly[ $\{3\text{-hydroxy-4-}[(E)\text{-}(4\text{-octyloxyphenyl})\text{diazenyl}]\text{phenoxy}\}\text{hexyl}\text{-2-methylprop-2-enoate}$  (PM6OA8) exhibits a smectic A phase, whereas the other polymers show a SmC phase.

Pyroelectric investigations show only an antiferroelectric behaviour for poly

$\{3\text{-hydroxy-4-}[(E)\text{-}(4\text{-dodecyloxyphenyl})\text{diazenyl}]\text{phenoxy}\}\text{hexyl}\text{-2-methylprop-2-enoate}$  (PM6OA12) and a para-electric behaviour for PM6OA8,

poly[ $\{4\text{-}[(E)\text{-}(4\text{-dodecyloxyphenyl})\text{diazenyl}]\text{phenoxy}\}\text{hexyl}\text{-2-methylprop-2-enoate}$  (PM6A12) and poly [ $\{4\text{-}[(E)\text{-}(4\text{-octyloxyphenyl})\text{diazenyl}]\text{phenoxy}\}\text{hexyl}\text{-2-methylprop-2-enoate}$  (PM6A8). Finall
