

Selective chemoembolization with adriamycin-Urografin-Lipiodol in the treatment of hepatocarcinoma Quimioembolización selectiva con adriamicina-Urografin-Lipiodol, en el tratamiento del hepatocarcinoma.

Brahm,

Chesta,

Gáinza,

Arriagada,

Various methods of regional chemotherapy have been used in patients with non resectable hepatic carcinoma. We report our preliminary experience with embolization using adriamycin-urographin-lipiodol in 2 patients with this cancer in whom a considerable reduction of tumoral mass was observed. The pertinent literature is briefly commented.
