

# Retraction of lower limbs in a female with hyperthyroidism Retracción de miembros inferiores en un paciente con hipertiroidismo

Donoso, S. Archibaldo

Michelson, D. Harold

Contreras, S. A.

We report a 47 years old woman with hyperthyroidism that had a severe tendinous retraction of hips and knees that subsided with propylthiouracil treatment. Electrodiagnosis showed myopathic alterations and muscle strength was moderately reduced. The authors did not find references of a similar condition in patients with hyperthyroidism.
