List of Tables	ix
1 Introduction	1
1.1 Protoplanetary disks	3
1.1.1 Protoplanetary disk structure	5
1.1.2 Transition disks: Asymmetries	6
1.2 Planet formation	7
1.2.1 Theories of protoplanet formation	7
1.2.2 Dynamics of dust grains: Coupling between gas and dust	8
1.2.3 The meter-size barrier problem	10
1.3 Dust traps	11
1.3.1 Vortices in protoplanetary disk	12
2 The case of the MWC 758 protoplanetary disk	14
2.1 Observational background	14
2.1.1 The MWC 758 star	15
2.1.2 Infrared observations	16
2.1.3 Radio observations	18
2.2 Motivation of the work carried out in the present MSc thesis	19
3 Hydrodynamical Simulations	21
3.1 Gas setup	21
3.2 Dust setup	24
3.3 Planets setup	26
4 Radiative Transfer	27
4.1 Thermal emission	27
4.1.1 Computation of the dust's surface density from dust's spatial distribution	28
4.1.2 Vertical expansion of the 2D dust's surface density field	29
4.1.3 Computation of the dust opacities	30
4.2 Polarized scattered light	31
5 Results	33
5.1 Gas and dust evolution	33
5.1.1 Temperature profile	42
5.1.2 Thermal emission in the (sub)mm	43
5.1.3 Y-band polarized scattered light	55

6	Discussion	59
6.1	Importance of gas self-gravity	59
6.2	Vortex decay	60
6.3	Impact of dust parameters	62
6.3.1	Dust's size distribution	62
6.3.2	Dust's total mass	63
6.3.3	Dust's internal density	64
6.4	On the location and mass of the possible planets in the MWC 758 disk . . .	65
6.5	On the origin of the third spiral arm and multiple concentric rings	66
7	Conclusion	68
8	Bibliography	70
