Introduction	1
1 Preliminaries	6
1.1 Automata networks	6
1.1.1 Elements of Graph Theory	6
1.1.2 Automata networks as discrete dynamical systems	8
1.1.3 Some important automata network families	9
1.1.4 Bounded degree automata networks	11
1.1.5 Algebraic automata networks	11
1.1.6 Freezing automata networks	11
1.1.7 Non-deterministic automata networks	12
1.2 Elements of computational complexity	13
1.2.1 Counting complexity	14
1.2.2 Parametric complexity	16
1.2.3 Parellel computing and NC	17
1.3 Toolbox	20
1.3.1 Automata networks dynamics	20
1.3.2 Treewidth and tree decompositions	21
1.3.3 Fast parallel subroutines	21
1.3.4 Arithmetic results	21
2 Measuring dynamical behavior	23
2.1 Automata network representations	24
2.1.1 Representation of some particular families	24
2.1.2 Computing interaction graphs from representations.	26
2.1.3 Standard representation	27
2.2 Simulation and universality	28
2.2.1 Simulation between automata networks	28
2.2.2 Simulation between families of automata networks	30
2.3 Decision problems and automata network dynamics	31
2.4 Universal automata network families	34
3 Gadget complexity: from local to global behavior	39
3.1 Putting pieces together: glueing automata networks	39
3.2 Computing on automata networks	42
3.2.1 \mathcal{G} -networks	42

3.2.2	\mathcal{G} -gadgets and simulation of \mathcal{G} -networks	45
3.2.3	Gadget glueing	46
3.3	Some useful families of \mathcal{G} -networks: \mathcal{G}_m -networks and $\mathcal{G}_{m,2}$ -networks	50
3.3.1	Closure and synchronous closure	58
3.3.2	Super-polynomial periods without universality	59
3.3.3	Conjunctive networks and \mathcal{G}_{conj} -networks	60
3.3.4	Super-polynomial transients without universality	62
4	Describing asynchronous dynamics: a deterministic approach	65
4.1	Update schemes	66
4.1.1	Periodic update schemes	66
4.1.2	Projection systems	69
5	Concrete symmetric automata networks: a case study	74
5.1	Symmetric conjunctive networks	75
5.1.1	Local clocks update scheme	75
5.1.2	Periodic update schemes	77
5.1.3	Firing memory schemes	80
5.2	Locally positive symmetric signed conjunctive networks	89
5.2.1	Block sequential update schemes	89
5.2.2	Local clocks update schemes	89
5.3	Symmetric signed conjunctive networks	90
5.3.1	Block sequential update schemes	91
5.4	Symmetric min-max networks	102
5.4.1	Block sequential update schemes	103
6	Freezing dynamics	106
6.1	Specification checking problem: a canonical model checking problem to capture many classical dynamical problems.	107
6.1.1	Localized Trace Properties	108
6.1.2	A fast parallel algorithm for Specification Checking	113
6.1.3	W[2]-hardness results	121
6.1.4	Hardness results for polynomial treewidth networks	124
6.2	Counting complexity on freezing automata networks: a case study.	132
6.2.1	CONTAGION-PROBABILITY is $\#P$ -Complete	135
6.2.2	Polynomial time algorithm for maximum degree 4	142
	Discussion	147
	Bibliography	151
