Supplementary Figure 1. QQ plot of GWAS of log-DHEAS. A) full GOCS cohort, B) only boys, and C) only girls. The genomic inflation factor for each GWAS was $\lambda$ $=1.022, \lambda=1.013$ and $\lambda=1$, respectively.

Supplementary Figure 2. Locus zoom of the top regions in the GWAS with logDHEAS. A genomic region of $\pm 400 \mathrm{~Kb}$ from the top variants of the GWAS is shown, including the main variant (purple diamond) of the region for the full cohort, boys, or girls. The closest genes and genomic coordinates for GRCh37 assembly at bottom. The color scale shows the linkage disequilibrium (LD) values ( $r^{2}$ ) relative to the main variant of the region and varies between absent LD (blue) and total LD (red) for Native American population (AMR). In gray, regions without LD information for the main variant. Images were prepared using LocusZoom (www.locuszoom.org).

## Full cohort

Supplementary Figure 2 continued.

Supplementary Figure 2 continued.

Supplementary Table 1. Genomic regions selected for targeted association with log-transformed DHEAS concentration. We considered DHEAS metabolism-related genes.

| Gene | Gene Name | Chromosome | Analysis Start (bp) | Analysis Stop (bp) | $\mathrm{N}^{\circ}$ of Variants |
| :---: | :---: | :---: | :---: | :---: | :---: |
| HSD3B2 | Hydroxy-delta-5-steroid dehydrogenase, 3 beta- and steroid delta-isomerase 2 | 1 | 119947554 | 119975662 | 64 |
| HSD11B1 | Hydroxysteroid 11-beta dehydrogenase 1 | 1 | 209849525 | 209918295 | 125 |
| POR | Cytochrome p450 oxidoreductase | 7 | 75534420 | 75626173 | 241 |
| CYP11B1 | Cytochrome P450 family 11 subfamily B member 1 | 8 | 143943773 | 143971236 | 127 |
| HSD17B5 | Hydroxysteroid (17-beta) dehydrogenase 5 (now AKR1C3) | 10 | 5080958 | 5159878 | 475 |
| PAPSS2 | 3'-phosphoadenosine 5'-phosphosulfate synthase 2 | 10 | 89409476 | 89517462 | 390 |
| CYP17A1 | Cytochrome P450 family 17 subfamily A member 1 | 10 | 104580288 | 104607290 | 65 |
| IGF1 | Insulin-like growth factor 1 | 12 | 102779645 | 102885563 | 174 |
| IGF1R | Insulin-like growth factor 1 receptor | 15 | 99182272 | 99517759 | 802 |
| HSD11B2 | Hydroxysteroid 11-beta dehydrogenase 2 | 16 | 67455036 | 67481456 | 41 |
| HSD17B2 | Hydroxysteroid 17-beta dehydrogenase 2 | 16 | 82058842 | 82142139 | 206 |
| MC2R | Melanocortin 2 receptor | 18 | 13872043 | 13925535 | 216 |
| CYB5A | Cytochrome b5 type A | 18 | 71910527 | 71969251 | 292 |
| SULT2A1 | Sulfotransferase family 2A member 1 | 19 | 48363723 | 48399654 | 166 |

Supplementary Table 2. Top significant variants in the targeted association analysis with log-DHEAS. All FDR-BH significant variants were in SULT2A1 gene and only in girls.

|  |  |  |  |  | Full cohort ( $\mathrm{N}=788$ ) |  |  | Girls ( $\mathrm{N}=390$ ) |  |  | Boys ( $\mathrm{n}=398$ ) |  |  |

*rs117978821 replaces rs574637649 which is not genotyped in the GOCS cohort. "Represents the same locus as rs2911280 at $16 q 13$ reported in Prims et al 2016. EAF: effect allele frequency.

Supplementary Table 4. Association of age at pubarche with child-DHEAS polygenic risk score in different models.

|  | Beta | $\mathbf{R}^{2}$ | $P$-value |
| :---: | :---: | :---: | :---: |
| Full cohort |  |  |  |
| Model 1 (child-DHEAS PRS) | -0.314 | 0.003 | 0.136 |
| Model 2 (child-DHEAS PRS + BMI-SDS) | -0.322 | 0.014 | 0.007 (0.124) |
| Model 3 (child-DHEAS PRS + BMI-SDS + sex) | -0.313 | 0.192 | <0.001 (0.098) |
| Girls only |  |  |  |
| Model 1 (child-DHEAS PRS) | -0.396 | 0.011 | 0.060 |
| Model 2 (child-DHEAS PRS + BMI-SDS) | -0.411 | 0.032 | 0.005 (0.049) |
| Boys only Model 1 (child-DHEAS PRS) | -0.218 | 0.001 | 0.481 |
| Model 2 (child-DHEAS PRS + BMI-SDS) | -0.221 | 0.024 | 0.010 (0.469) |
| Dependent variable: age at pubarche (years). Beta: effect size for age at pubarche (years). Children DHEAS polygenic risk score (PRS) included the genetic variants associated with log-DHEAS serum concentrations in the full cohort (Table 2). P values are shown for the model and for the variable children-DHEAS PRS in each model (in parenthesis). |  |  |  |
