

Contents

Introduction	1
1 Fundamental concepts	3
1.1 Closed quantum systems	3
1.2 Open quantum systems	4
1.2.1 Lindblad dynamics	5
1.2.2 Weak coupling limit	6
1.3 Quantum light and matter	7
1.3.1 Quantum electromagnetic waves	7
1.3.2 Atoms and spins	13
1.4 Nitrogen-Vacancy centers in diamond	18
1.4.1 Structure	18
1.4.2 The NV^- Hamiltonian	19
1.4.3 Constructing a spin qubit with the NV^-	21
1.4.4 NV^- spin qubit inside a resonator	23
2 Quantum batteries	25
2.1 A new quantum technology	25
2.2 Definition	26
2.2.1 Holder-only quantum batteries	26
2.2.2 Charger-based quantum batteries	26
2.3 Parallel and collective versions	29
2.4 Dynamical Figures of merit	29
2.5 Quantum advantage	31
2.6 Collective enhancement	31
2.7 Tavis-Cummings quantum batteries	32
2.8 Dissipation	32
2.9 Feasibility of experimental realizations	34
2.9.1 Condition of fast enough stage switching	34
2.10 Using NV centers for quantum batteries	35
3 Collective enhancement in dissipative Tavis-Cummings quantum batteries	37
3.1 Main simulation results	37
3.2 Comparison between initial conditions	40
Conclusions	46

A Quantum Markovian dynamical maps	47
B The Lindblad master equation from a microscopic derivation: the weak coupling limit	49
C Gauge invariance of the radiation field	52
D Relation between interaction hamiltonians in the Tavis-Cummings model	53
E Qubit ergotropy in the Jaynes-Cummings model	55
F Complementary plots and simulation's details	57
Bibliography	63
