

Tabla de Contenido

1. Introduction	1
1.1. Motivation: using DNN to describe PDEs	1
1.1.1. The case of the Laplacian	1
1.2. Main Objective	2
1.3. Setting: the Fractional Laplacian	2
1.3.1. First hypotheses	3
1.4. Stochastic representation and Montecarlo approximation	3
1.5. Use of WoS processes in the fractional case	3
1.6. Main tools: Deep Neural Networks (DNN)	4
1.6.1. The curse of dimensionality	5
1.7. Results of this thesis	5
1.7.1. Idea of proof	6
1.7.2. Step 1	6
1.7.3. Step 2	6
1.7.4. Step 3	7
1.7.5. Step 4	7
2. Preliminaries	8
2.1. Notation	8
2.2. A quick review on Lévy processes	8
2.3. Lévy processes and the Fractional Laplacian	10
2.4. Type s spaces and Monte Carlo Methods.	11
3. Deep Neural Networks	14
3.1. Setting	14
3.2. Operations	15
4. Walk-on-spheres Processes	19
4.1. Relation between WoS and isotropic α -stable process	22
5. Stochastic representation of the Fractional Laplacian	25
5.1. Stochastic Representation	25
5.2. Equivalent representations of non-homogeneous solution	26
6. Approximation of solutions of the Fractional Dirichlet problem using DNNs: the boundary data case	30
6.1. Homogeneous Fractional Laplacian	30
6.2. Proof of Proposition 6.1: existence	32

6.3. Proof of Proposition 6.1: Quantification of DNNs	43
7. Approximation of solutions of the Fractional Dirichlet problem using DNNs: the source case	46
7.1. Non-homogeneous Fractional Laplacian	46
7.2. Proof of Proposition 7.1: existence	47
7.3. Proof of Proposition 7.1: quantification of DNNs	59
8. Proof of the Main Result	63
9. Conclusions	66
9.1. Findings	66
9.2. Perspectives	67
Bibliografía	68
