Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.044; wR factor = 0.118; data-to-parameter ratio = 10.7.

In the title molecule, $C_{16}H_{16}O_3$, the ring system is planar and an intramolecular hydrogen bond is present. The molecular packing is dominated by an intermolecular hydrogen bond and by π -stacking interactions [interplanar separation 3.8012 Å].

supplementary materials

Comment

The title hydroquinone **I** is a potent antioxidant (Araya-Maturana *et al.*, 2007) and respiration inhibitor of cancer cells (Araya-Maturana *et al.*, 2006). In mouse mammary adenocarcinoma TA3 and their multidrug-resistant variant TA3-MTX-R lines exhibit IC₅₀ values below 10⁻⁴M. Moreover, this compound inhibits the growth of the human tumor U937 cell line at low micromolar concentrations (Araya-Maturana *et al.*, 2006).

The molecule consists of three six-membered carbon rings fused through atoms 4a, 9a in a side and through carbons 8a, 10a in the other, to give rise an anthracene skeleton, substituted with an oxo, a *gem*-dimethyl and two hydroxyl groups at positions 1, 4, 9 and 10 respectively, as shown in Scheme 1. The central ring is aromatic, and double bonds are also found between carbons 2 - 3 and 6 - 7. This double bonds distribution leads to the core to be strictly planar. In fact, all the carbon atoms in the skeleton lies on the crystallographic mirror plane *m* from space group Pnma. The same happens with the oxo oxygen atom O1 and the hydroxyl groups O2 and O3. Interestingly, the hydroxyl hydrogen atoms H2 and H3 display a *trans* correlation. The planarity of the molecule together with the proximity of the oxo oxygen atom (O1) and the hydroxyl hydrogen atom (H2) leads to the presence of an intramolecular O—H···O hydrogen bond with O···O of 2.5172 (18) Å, suggesting a rather strong bond (Desiraju, 2002), which is present still in CDCl₃ solution, as indicated by NMR (Araya-Maturana *et al.*, 2007). Few structures with this or some closely related pattern of substitution could be found in Cambridge Structural database (v 5.29, Allen, 2002), being 1,4-Dihydro-9,10-antrahydroquinone the best, probably the one to the best of our knowledge, example (Joshi *et al.*, 1997).

The molecular packing is also dominated by the hydrogen bond, this time between vicinal molecules. As depicted in Figure 2, a planar chain is produced by means of the interaction of the "terminal" hydroxyl hydrogen atom H3 with the oxo oxygen O1 from the nearest molecule (*x* - 1, *y*, *z*), in a "head to tail" arrangement in the [100] direction. The O···O distance, 2.8022 (18) Å, suggest a weaker interaction. Layers of molecules are defined in the packing by putting this chains one together the other, with no strong interaction between them. Any of the chain is contained in the *x*, 1/4, *z* plane. The next layer, *x*, 3/4, *z* is separated from the first in *b*/2, 3.8012 Å, a typical value for the aromatic π-stacking interaction.

Experimental

The molecule was synthesized by the Diels–Alder reaction between 8,8-dimethylnaphthalene-1,4,5(8*H*)-trione and butadiene). The cycloaddition takes place exclusively at external quinone double bond affording the corresponding adduct **I-a** (See Scheme 2). Enolization of the adduct **I-a** with silicagel in toluene yield the hydroquinone **I**. (Valderrama *et al.*, 1993). The ¹H-NMR spectrum in CDCl₃ of **I** exhibits a sharp singlet at 13.08 p.p.m. indicating that hydrogen bonding is also present in solution. This characteristic is important regarding antitumor and antioxidant properties.

Refinement

The hydrogen atoms positions were calculated after each cycle of refinement with *SHELXL* (Bruker, 1999) using a riding model for each structure, with C—H distances in the range 0.95 to 0.99 Å and O—H equal to 0.84 Å. $U_{\text{iso}}(\text{H})$ values were set equal to $1.5U_{\text{eq}}$ of the parent carbon atom for methyl groups and hydroxyl hydrogen atoms, while $1.2U_{\text{eq}}$ for the others.

Figures

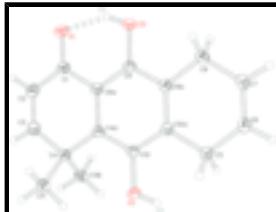

Fig. 1. Molecular structure diagrams for **I** showing atom numbering scheme. Displacement ellipsoids are at 33% probability level and H atoms are shown as spheres of arbitrary radii. Letter a corresponds to the names of fused carbon atoms according to the nomenclature rules. Letter B to symmcode $x, -y + 1/2, z$.

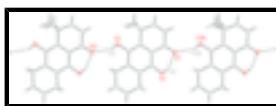

Fig. 2. Molecular packing view for **I** along [010]. [symmetry codes: (B) $x + 1, y, z$; (C) $x - 1, y, z$].

Fig. 3. The formation of the title compound.

Data collection

Siemens SMART CCD area-detector diffractometer	1198 independent reflections
Radiation source: fine-focus sealed tube	948 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.043$
$T = 150(2) \text{ K}$	$\theta_{\text{max}} = 25.0^\circ$
φ and ω scans	$\theta_{\text{min}} = 2.1^\circ$
Absorption correction: multi-scan (SADABS in SAINT-NT; Bruker, 1999)	$h = -10 \rightarrow 10$

$T_{\min} = 0.961$, $T_{\max} = 0.993$
7422 measured reflections

$k = -9 \rightarrow 9$
 $l = -22 \rightarrow 22$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.044$	H-atom parameters constrained
$wR(F^2) = 0.118$	$w = 1/[\sigma^2(F_o^2) + (0.0796P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{\max} < 0.001$
1198 reflections	$\Delta\rho_{\max} = 0.33 \text{ e } \text{\AA}^{-3}$
112 parameters	$\Delta\rho_{\min} = -0.29 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Experimental. 10 s by frame separated by 0.3 °

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Symmetry codes: (i) $x, -y+1/2, z$.

Hydrogen-bond geometry (\AA , $^\circ$)

$D\cdots H\cdots A$	$D—H$	$H\cdots A$	$D\cdots A$	$D—H\cdots A$
O2—H2 \cdots O1	0.84	1.77	2.5172 (18)	147
O3—H3 \cdots O1 ⁱⁱ	0.84	2.03	2.8022 (18)	152

Symmetry codes: (ii) $x-1, y, z$.
