<b>Introduction</b>	<b>1</b>
<b>1. Coordinated defender strategies for border patrols</b>	<b>4</b>
1.1. Introduction . . . . .	4
1.2. Problem Formulation and Notation . . . . .	6
1.2.1. Stackelberg Security games . . . . .	6
1.2.2. Resource Combination in a SSG . . . . .	9
1.3. Decomposition Model . . . . .	12
1.3.1. (COMB) is an equivalent SSG formulation . . . . .	13
1.3.2. Cutting Odd-Set Constraints . . . . .	16
1.3.3. Recovering an implementable strategy . . . . .	18
1.4. Case Study: Carabineros de Chile . . . . .	22
1.4.1. Payoff estimation . . . . .	24
1.4.2. Building software for Carabineros . . . . .	26
1.4.3. Robustness of our approach . . . . .	27
1.5. Computational Experiments . . . . .	28
1.5.1. Performance of (COMB) . . . . .	28
1.5.2. Performance of the alternative sampling method . . . . .	30
1.6. Conclusions and future work . . . . .	31
<b>2. Abstractions to handle large scale models.</b>	<b>32</b>
2.1. Layer Generating Algorithm . . . . .	33
2.2. Multi-Layer Generating Algorithm . . . . .	36
2.3. Conclusions . . . . .	37
<b>3. Solving Stackelberg equilibrium in stochastic games</b>	<b>39</b>
3.1. Introduction . . . . .	39
3.2. Literature Review . . . . .	41
3.2.1. General results . . . . .	42
3.2.2. Math programming to solve Stochastic Games . . . . .	43
3.3. Motivational Example . . . . .	46
3.4. Numerical Example 1 . . . . .	49
3.5. Special case: Myopic Follower Strategies (MFS) . . . . .	53
3.5.1. Stackelberg operator and Value function iteration . . . . .	54
3.5.2. Policy Iteration . . . . .	58
3.6. General Case . . . . .	60

3.6.1. Definition of the Stackelberg Operator in the general case . . . . .	61
3.6.2. Numerical Example 2 . . . . .	62
3.6.3. Value Function and Policy Function for the general case . . . . .	65
3.6.4. What does it fail? . . . . .	68
3.7. Mathematical Programming approach . . . . .	70
3.8. Computational Experiments . . . . .	73
3.8.1. Performance of algorithms: (MFS) case. . . . .	73
3.8.2. Stackelberg Security Games . . . . .	75
3.8.3. General Case . . . . .	76
3.8.4. Sensitivity analysis in $\beta$ . . . . .	78
3.9. Conclusions and Future work . . . . .	80
<b>4. Stackelberg games of water extraction</b>	<b>81</b>
4.1. Introduction . . . . .	81
4.2. A first study . . . . .	82
4.3. Preliminary results . . . . .	83
4.4. Robust approach . . . . .	84
4.5. Conclusions and future (current) work . . . . .	86
<b>Conclusion</b>	<b>86</b>
<b>Bibliography</b>	<b>89</b>

# List of Tables

1.1.	Tabular representation for the feasible schedule in Figure 1.8 . . . . .	23
3.1.	Transition matrix and payoffs for each player. . . . .	49
3.2.	Bi-matrix games in $\tau = 2$ . . . . .	50
3.3.	Bi-matrix games at stage 1. . . . .	51
3.4.	Transition matrix and payoffs for each player in the numerical example 2. . .	62
3.5.	Bi-matrix games at stage 14 for numerical example 2. . . . .	62
3.6.	Bi-matrix games at stage 15 for numerical example 2. . . . .	62
3.7.	Iterations 14 and 15 for numerical example 2. . . . .	63
3.8.	Transformation of the matrix in numerical example 2 to a Leader-controller case. . . . .	65
3.9.	Solution times and iterations performed by algorithms in myopic instances. .	74
3.10.	Resolution time and iterations performed by algorithms in Leader Controller Instances. . . . .	75
3.11.	Resolution time and iterations performed by algorithms in General instances, for instances where $T$ is not detected to be not contractive. . . . .	77
3.12.	Transition matrix and payoffs for each player in the Numerical Example 3. .	79
4.1.	Parameters in our preliminary study. . . . .	83

# List of Figures

1.1. Variables $\mathbf{z} \in [0, 1]^{ E }$ that satisfy (1.26) and (1.27) but violate (1.28) for $m = 2$ .	12
1.2. Variables $\mathbf{z} \in [0, 1]^{ E }$ and $\mathbf{c} \in [0, 1]^{ J }$ that do not satisfy (1.29) and (1.30) with $m = 2$ . . . . .	13
1.3. Construction to identify implementable mixed strategy $\mathbf{x}$ given vectors $\mathbf{z}, \mathbf{c}, \mathbf{g}$ feasible for (COMB). . . . .	16
1.4. Representation of the algorithm which detects the Odd min cut set. The dashed edges shows the min cut of this graph. . . . .	18
1.5. Example of the warm start algorithm. . . . .	21
1.6. A Carabinero conducts surveillance. . . . .	23
1.7. Harsh border landscape. . . . .	23
1.8. Feasible schedule for a week. Elaborated by Carlos Casorrán. . . . .	23
1.9. Three crime flow networks, one per type of crime. Elaborated by Carlos Casorrán.	25
1.10. Robustness of the solution method to variations in the parameters $\lambda$ and $h$ .	28
1.11. Performance for $m = 2$ , $m = 3$ and $m = 10$ : Solving time (s.) vs. number of nodes in graph. . . . .	29
1.12. Kullback-Leibler distance between $z^*$ and $\hat{z}$ over instances of different size . .	30
 2.1. Layers of targets generated by the Greedy Multi-Layer Algorithm algorithm. . . . .	37
3.1. Expected reward for each player and SSE in the game played in state $s_1$ at stage $\tau = 2$ . . . . .	51
3.2. Expected reward for each player and SSE in the game played in state $s_2$ at stage $\tau = 2$ . . . . .	51
3.3. Expected reward for each player and SSE in the game played in state $s_1$ at stage 1. . . . .	52
3.4. Expected reward for each player and SSE in the game played in state $s_2$ at stage 1. . . . .	52
3.5. Value Function vs time in numerical example 1. . . . .	53
3.6. Value Function vs time in numerical example 2. . . . .	64
3.7. Value Function vs time in numerical example 2 in the myopic case ( $\beta_B = 0$ ). .	64
3.8. Value Function vs time in numerical example 2 in Leader-controller case. . .	65
3.9. Convergence of $v_A$ starting from different starting values $(v_A^0, v_B^0)$ . . . . .	69
3.10. Convergence of $v_B$ starting from different starting values $(v_A^0, v_B^0)$ . . . . .	69
3.11. Performance of VI and PI in myopic instances. . . . .	74
3.12. Performance of VI and PI in Leader Controller instances. . . . .	75

3.13. Performance of value function iteration and policy iteration in security games instances. . . . .	76
3.14. Percentage of instances where the Algorithm 12 returns undefined. . . . .	77
3.15. Performance of value function iteration and policy iteration in General random instances generated, for instances where it is not detected that the operator $T$ is not contractive. . . . .	78
3.16. Sensitivity analysis in solution times for VI algorithm when $\beta_A$ changes. . . . .	78
3.17. Sensitivity analysis in solution times for PI algorithm when $\beta_A$ changes. . . . .	79
3.18. Impact of $\beta_A$ and $\beta_B$ on the convergence in VI in Numerical Example 3. . . . .	79
4.1. Groundwater level and consumption for $\beta_A \in \{0.2, 0.7, 0.9\}$ . . . . .	83
4.2. Policies for $\beta_A \in \{0.2, 0.7, 0.9\}$ . . . . .	84
